<b>Duration</b>	1 hour 3 mins

**Question 1**

Correct

A single line L with a set of space separated values indicating distance travelled and time taken is passed as the input. The program must calculate the average speed S (with precision upto 2 decimal places) and print S as the output.

**Note:** The distance and time taken will follow the format DISTANCE@TIMETAKEN. DISTANCE will be in kilometers and TIMETAKEN will be in hours.

**Input Format:**

The first line contains L.

**Output Format:**

The first line contains the average speed S.

**Boundary Conditions:**

Length of L will be from 3 to 100.

**Example Input/Output 1:**

Input:

60@2 120@3

Output:

36.00 kmph

Explanation:

Total distance =  $60+120 = 180$  km.

Total time taken =  $2+3 = 5$  hours.

Hence average speed =  $180/5 = 36.00$  kmph

**For example:**

Input	Result
60@2 120@3	36.00 kmph

**Answer:** (penalty regime: 0 %)

```

1 #include<stdio.h>
2 #include<string.h>
3 int main()
4 {
5     char input[1000];
6     fgets(input,sizeof(input),stdin);
7     double totaldistance=0, totalTime=0;
8     char*token=strtok(input, " ");
9     while (token !=NULL){
10         double distance,time;
11         sscanf(token,"%lf@%lf",&distance,&time);
12         totaldistance+=distance;
13         totalTime+=time;
14         token=strtok(NULL, " ");
15     }
16     double avgsspeed=totaldistance/totalTime;
17     printf("%.2f kmph\n",avgsspeed);
18     return 0;
19 }
```

	Input	Expected	Got	
✓	60@2 120@3	36.00 kmph	36.00 kmph	✓

Passed all tests! ✓

**Question 2**

Correct

The program must accept two numbers X and Y and then print their HCF/GCD.

**Input Format:**

The first line denotes the value of X.

The second line denotes the value of Y.

**Output Format:**

The first line contains the HCF of X and Y.

**Boundary Conditions:**

$1 \leq X \leq 999999$

$1 \leq Y \leq 999999$

**Example Input/Output 1:**

Input:

30

40

Output:

10

**Example Input/Output 2:**

Input:

15

10

Output:

5

**For example:**

Input	Result
30	10
40	

**Answer:** (penalty regime: 0 %)

```

1 #include<stdio.h>
2 int main()
3 {
4     int x, y;
```

```
5      scanf("%d",&x);
6      scanf("%d",&y);
7  while (x !=y){
8      if(x>y)
9          x=x-y;
10     else
11         y=y-x;
12  }
13  printf("%d\n",x);
14  return 0;
15 }
```

	<b>Input</b>	<b>Expected</b>	<b>Got</b>	
30	10	10	10	✓
40				

Passed all tests! ✓

**Question 3**

Correct

A string S is passed as input. S will contain two integer values separated by one of these alphabets - A, S, M, D where

- A or a is for addition
- S or s is for subtraction
- M or m is for multiplication
- D or d is for division

The program must perform the necessary operation and print the result as the output. (Ignore any floating point values just print the integer result.)

**Input Format:**

The first line contains S.

**Output Format:**

The first line contains the resulting integer value.

**Boundary Conditions:**

Length of S is from 3 to 100.

**Example Input/Output 1:**

Input:

5A11

Output:

16

Explanation:

As the alphabet is A, 5 and 11 are added giving 16.

**Example Input/Output 2:**

Input:

120D6

Output:

20

**Example Input/Output 3:**

Input:

1405d10

Output:

140

**For example:**

Input	Result
5A11	16
120D6	20
1405d10	140

**Answer:** (penalty regime: 0 %)

```

1 #include<stdio.h>
2 #include<string.h>
3 #include<ctype.h>
4 int main()
5 {
6     char s[101],op;
7     long long n1=0,n2=0;
8     scanf("%s",s);
9     int i=0;
10    while(isdigit(s[i])){
11        n1=n1*10+(s[i++]-'0');
12    }
13    op=toupper(s[i]);
14    i++;
15    while(isdigit(s[i])){
16        n2=n2*10+(s[i++]-'0');
17    }
18    switch(op){
19        case 'A':n1+=n2;break;
20        case 'S':n1-=n2;break;

```

```
21     case 'M':n1*=n2;break;
22     case 'D':n1/=n2;break;
23   }
24   printf("%lld\n",n1);
25   return 0;
26
27
28
29 }
```
